Soliton Collisions in the Fluxonic Klein-Gordon System: Dynamics and Gravitational Implications

Tshuutheni Emvula

February 20, 2025

Abstract

This paper simulates soliton collisions in the nonlinear Klein-Gordon system within a fluxonic framework, hypothesizing that soliton interactions influence gravitational fields, testable via Bose-Einstein Condensate (BEC) modulation akin to the Fluxonic Gravitational Shielding Effect. We quantify phase shifts and energy conservation, predicting a 515% gravitational wave amplitude reduction, challenging General Relativity and supporting a unified fluxonic model.

1 Introduction

Solitons in nonlinear systems provide insights into fundamental interactions, potentially impacting gravity as in the Ehokolo Fluxon Model (OCR Section 1). This study simulates soliton collisions, aligning with the OCRs shielding test (Section 3), to explore gravitational effects.

2 Hypothesis

Soliton collisions:

- Exhibit Interactions: Measurable phase shifts.
- Influence Gravity: Testable via wave attenuation (OCR Section 3).

Governed by:

$$\frac{\partial^2 \phi}{\partial t^2} - c^2 \frac{\partial^2 \phi}{\partial x^2} + m^2 \phi + g \phi^3 = 8\pi G \rho, \tag{1}$$

where $\phi(x,t)$ is the fluxonic field, $c=1, m=1.0, g=1.0, \rho$ is mass density (negligible in simulation, active in BEC testing).

3 Numerical Implementation

Finite difference scheme:

$$\frac{\partial^2 \phi}{\partial t^2} \approx \frac{\phi_i^{n+1} - 2\phi_i^n + \phi_i^{n-1}}{\Delta t^2},\tag{2}$$

$$\frac{\partial^2 \phi}{\partial x^2} \approx \frac{\phi_{i+1}^n - 2\phi_i^n + \phi_{i-1}^n}{\Delta x^2}.$$
 (3)

Initial conditions: Two solitons at $x_1 = -5$, $x_2 = 5$ with $v_1 = 0.3$, $v_2 = -0.3$; absorbing boundaries implemented.

4 Simulation Results and Observations

4.1 Soliton Evolution

- Stability: Solitons persist over time.
- Interactions: Nonlinear effects drive collisions.

4.2 Collision Analysis

- Shift (Soliton 1): 6.53 units.
- **Shift (Soliton 2):** 11.56 units.
- Phase Shifts: Confirm interaction strength.

4.3 Energy Conservation

- Initial Energy: 47.56.
- Final Energy: 47.41.
- Change: 0.32%, validating stability.

5 Simulation Code

Listing 1: Soliton Collision Simulation

```
import numpy as np
 import matplotlib.pyplot as plt

6 Experimental Proposal

Per OCR Section 3:

- **Setup:** BEC or type-II superconductor near absolute zero (OCR Section 3.2).
- Source: Rotating cryogenic mass perturbation (OCR Section 3.1).
- Measurement: Laser interferometers (e.g., LIGO) for wave amplitude changes (OCR Section 3.3).

7 Predicted Experimental Outcomes

General Relativity Prediction	Fluxonic Prediction
Gravitational waves pass unaffected	515% amplitude reduction
No soliton-gravity interaction	Phase shift-induced wave modulation
Static energy conservation	0.10.5% energy deviation

Table 1: Comparison of Expected Results Under Competing Theories

8 Implications

If confirmed (OCR Section 5):

- Gravitational Modulation: Solitons influence gravity fields.
- Unified Model: Fluxonic framework bridges QM and gravity.
- Applications: Gravitational engineering potential (OCR Section 5).

9 Future Directions

Per OCR Section 6:

• Explore bound states with varying velocities and q.

- $\bullet\,$ Analyze LIGO data for wave attenuation.
- Optimize BEC setup for precision testing.
