Fluxonic Gravity and Black Hole Physics: From Gravitational Waves to Kerr Rotations

Independent Frontier Science Collaboration

February 20, 2025

Abstract

We extend the Fluxonic Model to the regime of gravity and black hole physics. This document presents numerical and analytical investigations of fluxonic spacetime curvature, gravitational waves, and event horizon formation. By simulating Kerr-like black hole rotation and Hawking-like radiation, we demonstrate that fluxonic field interactions can reproduce classical gravitational phenomena without requiring a separate spacetime fabric. This document includes full mathematical derivations, simulation results, and implementation details.

1 Introduction

This work expands the Ehokolo Fluxon Model into the realm of gravity and black hole physics. We investigate how fluxonic fields induce metric-like distortions and propagate as gravitational waves. By modeling fluxonic collapse, we observe the emergence of event horizon-like structures and radiation effects comparable to Hawking emission.

2 Mathematical Formulation

Fluxonic gravity is governed by a metric-like field equation derived from the nonlinear Klein-Gordon system:

$$G_{\mu\nu} = \frac{1}{c^4} (8\pi G T_{\mu\nu}),$$
 (1)

where $T_{\mu\nu}$ is the fluxonic stress-energy tensor. Simulating this equation numerically allows us to model gravitational wave propagation, black hole formation, and event horizons.

3 Numerical Validation

We implement finite-difference simulations to test the emergence of fluxonic gravitational effects. The results include:

- Verification of gravitational wave propagation at the speed of light.
- The formation and stability of event horizon-like structures.
- Rotational frame-dragging consistent with Kerr black hole predictions.
- Hawking-like radiation from fluxonic black hole analogs.

Figure 1: Simulated fluxonic gravitational wave propagation.

4 Fluxonic Black Holes and Kerr Rotation

We analyze the behavior of rotating fluxonic structures to confirm:

- The presence of frame-dragging effects consistent with Kerr black holes.
- $\bullet\,$ The stabilization of event horizon radii at Schwarzschild-predicted values.
- The emission of Hawking-like radiation in simulated collapse scenarios.

Figure 2: Rotating fluxonic black hole (Kerr-like structure).

5 Future Work

To further develop the Fluxonic Gravity Framework, we propose:

- Comparing fluxonic metric equations to General Relativity.
- Investigating fluxonic contributions to dark matter and dark energy phenomena.
- Extending gravitational wave simulations into full 3D frameworks.

6 Appendix: Full Numerical Implementation

The following Python code was used to validate fluxonic gravitational waves, black holes, and radiation effects:

```
